Does not apply to this measure

Brief Abstract

DESCRIPTION

This population-based measure is used in primary care settings to assess the percent of clinically significant depression* patients with a 50 percent or greater reduction in Patient Health Questionnaire (PHQ) 4 months or longer after the last New Episode PHQ**.

This measure demonstrates 4-month response rate of a treated population and allows comparison to published research outcomes. Patients who are less than 4 months into treatment would not be expected to have a consistent response and are excluded from this measure (Katon W, et al., JAMA 1995; Unutzer J, et al., JAMA 2002).

Note: The universe of patients (denominator) for this measure is limited to the last 12 months, This enables monitoring of changes in performance in the last 12 calendar months on a continuing basis.

*Clinically significant depression = Patient with a diagnosis of depression and a New Episode PHQ of 10 or greater

**New Episode PHQ = The PHQ measurement item that is used to track the PHQ results at the beginning of a depressive episode

RATIONALE

Depression is one of the most common chronic illnesses in the United States, with a one-year prevalence rate of 5-6 percent. Depression is twice as common in women as in men; it is estimated that 20 percent of women and 10 percent of men will have an episode of major depression at some point in their lives. Depression often takes a severe toll on the physical and social functioning of those who suffer from it. According to one study using the SF-36 quality-of-life measure, depression impaired social functioning more than any other chronic illness, including arthritis, diabetes, congestive heart failure (CHF), angina, and hypertension; and impaired physical functioning more than any other chronic condition except the cardiac illnesses.

Depression care in the United States is even more fragmented than care of other chronic illnesses, creating a major gap between the recommended guidelines for care and actual care. It is estimated that only 19 percent--fewer than 1 in 5--of people with depression who see their primary care provider receive appropriate, guideline-based care.

Improving depression care is not only a matter of meeting the typical challenges of providing good chronic illness care--following people over time rather than responding to acute episodes, providing systematic follow-up to ensure that patients adhere to treatment plans, and so on. In addition, depression care brings its own complex set of challenges, ranging from underdiagnosis to financial disincentives for providers to special treatment requirements because the underlying nature of the illness frequently undercuts patients' ability to be effective managers of their own care.

This measure is one of 8 additional recommended measures in the HRSA Health Disparities Collaborative for Depression; participants choose to track at least one of these measures. Participants also track 5 measures for the Depression Collaborative.

PRIMARY CLINICAL COMPONENT

Clinically significant depression; symptom reduction; Patient Health Questionnaire (PHQ)

DENOMINATOR DESCRIPTION

All patients with a diagnosis of clinically significant depression* 4 months or longer after the last New Episode Patient Health Questionnaire (PHQ)***, and last New Episode PHQ is within the last 12 calendar months

*Clinically significant depression = Patient with a diagnosis of depression and a New Episode PHQ of 10 or greater

**New Episode PHQ = The PHQ measurement item that is used to track the PHQ results at the beginning of a depressive episode

NUMERATOR DESCRIPTION

All patients with a diagnosis of clinically significant depression* who, 4 months or longer after the last New Episode Patient Health Questionnaire (PHQ)** (occurring within the last 12 calendar months), have a 50 percent or greater reduction in PHQ

*Clinically significant depression = Patient with a diagnosis of depression and a New Episode PHQ of 10 or greater

**New Episode PHQ = The PHQ measurement item that is used to track the PHQ results at the beginning of a depressive episode

Evidence Supporting the Measure

EVIDENCE SUPPORTING THE CRITERION OF QUALITY

- A formal consensus procedure involving experts in relevant clinical, methodological, and organizational sciences
- One or more research studies published in a National Library of Medicine (NLM) indexed, peer-reviewed journal

CASE FINDING

Users of care only

DESCRIPTION OF CASE FINDING

All patients with a diagnosis of clinically significant depression* 4 months or longer after the last New Episode Patient Health Questionnaire (PHQ)** , and last New Episode PHQ is within the last 12 calendar months

*Clinically significant depression = Patient with a diagnosis of depression and a New Episode PHQ of 10 or greater

**New Episode PHQ = The PHQ measurement item that is used to track the PHQ results at the beginning of a depressive episode

DENOMINATOR SAMPLING FRAME

Patients associated with provider

DENOMINATOR INCLUSIONS/EXCLUSIONS

Inclusions

All patients with a diagnosis of clinically significant depression* 4 months or longer after the last New Episode Patient Health Questionnaire (PHQ)** , and last New Episode PHQ is within the last 12 calendar months

*Clinically significant depression = Patient with a diagnosis of depression and a New Episode PHQ of 10 or greater

**New Episode PHQ = The PHQ measurement item that is used to track the PHQ results at the beginning of a depressive episode

Exclusions

Patients who are less than 4 months into treatment would not be expected to have a consistent response and are excluded from this measure.

RELATIONSHIP OF DENOMINATOR TO NUMERATOR

All cases in the denominator are equally eligible to appear in the numerator

DENOMINATOR (INDEX) EVENT

Clinical Condition
Diagnostic Evaluation

DENOMINATOR TIME WINDOW

Time window precedes index event

NUMERATOR INCLUSIONS/EXCLUSIONS

Inclusions

All patients with a diagnosis of clinically significant depression* who, 4 months or longer after the last New Episode Patient Health Questionnaire (PHQ)** (occurring within the last 12 calendar months), have a 50 percent or greater reduction in PHQ

*Clinically significant depression = Patient with a diagnosis of depression and a New Episode PHQ of 10 or greater

**New Episode PHQ = The PHQ measurement item that is used to track the PHQ results at the beginning of a depressive episode

Exclusions

Unspecified

MEASURE RESULTS UNDER CONTROL OF HEALTH CARE PROFESSIONALS, ORGANIZATIONS AND/OR POLICYMAKERS

The measure results are somewhat or substantially under the control of the health care professionals, organizations and/or policymakers to whom the measure applies.

NUMERATOR TIME WINDOW
